

Phase-2 Requirement & Analysis

Date	28-09-2025
Team ID	SWTID-2026-7624
Project name	Script-controlled ACL
Maximum Mark	4 mark

Phase 2: Requirements & Analysis is the stage where the needs, expectations, functions, security rules, and system requirements of the application are identified and analyzed. In this phase, the required features of the ServiceNow application are clearly defined, along with the access permissions given to different users.

For this project, the main focus is to securely manage student records of the EEE branch. The requirements define how users can view, create, edit, and delete records based on their assigned roles. The security requirements also ensure that unauthorized users cannot access student information belonging to other branches such as ECE and CSE.

This phase helps to clearly understand the customer journey, functional requirements, non-functional requirements, user roles, and Access Control List (ACL) rules before developing and testing the system. It ensures that the application is secure, organized, and meets the required user and administrative needs.

Phase 2: Requirements & Analysis

Definition

Phase 2: Requirements & Analysis is the stage where the needs, expectations, functions, security rules, and system requirements of the application are identified and analyzed. It defines what the ServiceNow application should do, who can access the student records, and what permissions each user role should have.

In short:

It helps to clearly define the user needs, security rules and system requirements before development and testing.

Customer Journey Map

Shows the step-by-step experience of the EEE Department User while using the ServiceNow platform.

Requirements Breakdown

Defines the formal Functional and Non-Functional requirements for building and validating the application.
