Project name	Script-controlled ACL
Maximum marks	4 marks

1. Customer Journey

The customer journey describes how a user interacts with the Script-Controlled ACL system from login to accessing the required records. The system checks the user's role and applies the required access restrictions before displaying the records.

Step 1: User Login

The user logs into the ServiceNow system using valid credentials.

Step 2: User Identification

After successful login, the system identifies the logged-in user's assigned roles.

Step 3: Access Request

The user attempts to access the Institution Details table and view available records.

Step 4: Role Verification

The system checks whether the user has the required role such as bb1, bb2, bb3, or bb4.

Step 5: Field-Based Verification

For users with the bb1 role, the system checks the Branch field of the record and applies the defined access condition.

Step 6: Access Decision

Based on the user's role and the access-control conditions, the system either allows or denies the requested operation.

Step 7: Record Access

If the conditions are satisfied, the user can perform the permitted operation. Otherwise, access is denied.

Step 8: Administrative Access

Users with the admin role are provided unrestricted access to the records.

Customer Journey Flow

Login → User Identification → Role Verification → Field Verification → Access Decision → Allow/Deny → Record Access
